Housing Operations Platform

User Manual (English) — V1.0

Applicable to platform releases from November 2026. This guide covers the English interface; business data names can be translated under System & Data → Data Translations.

1. Overview

The platform manages public and affordable rental housing: housing inventory, eligible persons, applications, contracts, billing, deposits, subsidies, energy allocation, devices, access control and system administration.

Main modules:

- Operations Dashboard — live housing, finance, device and service indicators
- Housing & Space — housing inventory, spaces and bed management
- Eligibility — person profiles, eligibility files and identity verification
- Contracts & Leasing — applications, contracts, renewals, changes, terminations
- Billing & Finance — fee items, bills, payments, deposits, subsidies, cash flow
- Metering & Energy — meter readings, monthly allocation, energy analysis
- Service & Devices — work orders, alerts, devices, access grants and keyrings
- System & Data — organizations, users, roles, dictionaries, parameters and data translations

2. Sign in and switch language

Open the platform URL and enter the platform code, username and password. The default language is Simplified Chinese.

Use the language selector in the top-right corner (EN / ZH). The choice is saved in the browser and on your user profile, so it follows you on the next sign-in.

Element Plus components, menus, tables, forms, dialogs and validation messages switch with the selected language. Business master data (organization, housing, person and fee item names) switches when translations have been maintained.

3. Operations Dashboard

The dashboard aggregates housing mix, occupancy, receivables, unpaid bills, collection rate, subsidies, device events, alerts, work orders, applications and deposits.

Use All / My Organization to change scope, Refresh to reload, and Full Screen for the operations wall display. Metric Details lists every metric with its code, current value and description.

4. Housing, spaces and persons

Housing: search by organization, code/name, status and type. Create housing with organization, space node, code, name, type, building area and rent standard. Use Bed Management for bed-level inventory.

Occupancy shows the active contract, lease term, lessee, phone, occupant count and cohabitants.

Persons: maintain person profiles, identity verification and eligibility files. An application requires a verified identity; approval requires an eligibility file. Qualification checks income level, property ownership and talent validity.

5. Applications and contracts

Applications move through Submitted → Accepted → Reviewing → Approved/Rejected, with a full review history.

Contracts: create a contract, submit for signing, sign, renew, change or terminate. Changes and terminations preserve the original record for audit.

Quick signing creates a contract from person, housing, lease dates, rent and deposit in one dialog. The system validates availability and overlapping leases.

6. Billing and payments

Fee items define the billing method: fixed, by area, by unit, by person, by bed, by night or meter. Billing rules support standard, tiered, discount and exemption pricing, with approval before use.

Bills can be generated one by one, in batch, by meter reading or by allocation. Each bill stores amount, paid amount, waived amount, payable amount, due date and status.

Register payments, then allocate them to bills. Deposits support receive, deduct and refund with approval. Subsidies support batch issue, bank transfer or rent offset. Cash Flow provides reconciliation and payment confirmation.

7. Metering and energy

Maintain meters by space and fee item. Enter manual readings or pull readings from IoT; readings feed meter-based bills.

Monthly Allocation splits a building meter by occupancy days and person-days. Vacant-bed cost can be borne by the operator or by occupants, configured in Policy. Energy Analysis compares total and submeter usage and flags excessive differences.

8. Work orders, alerts, devices and access

Work orders support assignment, acceptance, completion, SLA tracking and inspection plans. Alerts support handling, escalation and conversion to work orders; rule sets define thresholds.

Devices show online status, battery and events. Bind devices to housing spaces; residents inherit access through the space chain. Keyrings bind persons to credentials such as face, fingerprint, card or password. Access grants can be reconciled against IoT and audited.

9. System and permissions

Organizations form a tree used for data scope. Users are assigned roles; roles carry data scope and permission codes. Administrators have all permissions.

System Support provides audit logs, data dictionaries and system parameters. The Platform Console creates platforms, initial administrators and reviews operations audits.

10. Data translations

Open System & Data → Data Translations. Choose the resource type, enter the resource ID and the English name, then save. The translation is applied automatically to lists and detail pages in the English interface.

Resource types: organization, housing, person, space, fee item and device. Only the name field is translated; codes, amounts and dates are not changed.

11. Common questions

The interface is English but some names are still Chinese.

Maintain those names in Data Translations; business data is not machine translated.

A menu is missing.

The role lacks the required permission. Ask an administrator to grant the permission code.

A bill cannot be generated.

Check that the fee item, billing rule, contract status and billing period are valid.

A door cannot be opened.

Check the access grant, keyring status and IoT reconciliation differences.

Where can I see who changed a record?

Use Audit Log for system changes, Grant Audit for access grants and Work Order Log for service actions.
